Record your handover

Autonomous Supermarket | Assignment 4 | Prepared 14 October 2026

Required delivery	Aim for
One MP4, 4-8 minutes, working audio. Show your face and student ID.	About 6 minutes 40 seconds. Demonstrate the working website.

Before you start

Keep the app running at **http://127.0.0.1:3001**. If needed, run **npm.cmd run build** then **npm.cmd start** from the project folder. On Home, identify the row marked **Submitted Run**. Rehearse the route on page 2 once before recording.

Have your student ID ready, close unrelated windows and silence notifications. Keep browser text readable. Place your camera away from report figures and the Run ID; briefly enlarge it for your introduction if needed.

Set up OBS Studio

If you already have a recorder that captures your screen, microphone and face, use it. Otherwise, download OBS from obsproject.com/download. These steps follow the official OBS quick start.

1. Prepare the scene

Run **Tools > Auto-Configuration Wizard** for recording. In **Sources**, add **Window Capture** for the browser, or **Display Capture** for your screen. Add **Video Capture Device** for your webcam and position it above the screen source.

2. Check your microphone

Speak and confirm the Audio Mixer meter moves. If needed, select the microphone in **Settings > Audio**. Make a short test recording and play it back: confirm your voice, face, ID and report text are clear.

3. Choose the output

In **Settings > Output**, choose a recording folder and **MKV** format. After recording, convert it to MP4 using the steps on page 4. Select **Start Recording**, return to the browser and follow the timed route.

Preparation tip: use the prompts as notes and speak in your own words. You do not need to demonstrate every feature, read the README aloud or show source code.

Your recording route

A suggested 6:40 walkthrough. Main tabs are shown first, followed by secondary tabs.

Time	Show in the app	Explain briefly
0:00-0:25	Home, your face and student ID.	Introduce yourself and the fictional unattended Melbourne CBD supermarket. A remote manager reviews its 60-day operation.
0:25-1:10	New Simulation: settings, sample opening products and funding. Back to Home > View the Submitted Run. Point to its full Run ID.	Opening inventory is capped at A$40,000; replenishment cash starts separately at A$15,000. The submitted history is already retained. Return without changing settings or starting another run.
1:10-1:45	Model Declaration > Overview, Customers & demand, then Expiry or Store Brain.	This submitted run assumes 200 weekday and 300 weekend visits before variation. Missions affect baskets and demand. Expired batches are removed before sales; orders arrive the next day and must be affordable.
1:45-2:35	Performance > Overview, Shoppers, Categories and Products. Operations > Overview and Category health.	Highlight revenue, gross profit, shopper variation and the leading category. Show stockouts, expiry and slow movers. State that cash constraints are zero in this run; do not skip zero outcomes.
2:35-3:50	Diagnosis > Product mix, Availability & waste, Cash & viability.	Explain the three findings and their practical next steps. Use the short prompts on page 3; connect evidence to diagnosis and recommendation.
3:50-5:20	Diagnosis > Availability & waste > Trace to Day 45. Daily Report > Inventory, Store Brain, then Records.	Show bread expiry, its inventory equation and stored batch record. Then open one transaction to connect requested basket, valid source batches, inventory deductions and cash receipt. Follow page 4.
5:20-6:15	Assurance > Checks & exceptions, History, Inventory, Revenue and Operating cash.	Show PASS status, 60/60 retained days, audit record counts and the inventory, revenue and cash checks. Expand financial calculations. Orders are checked against cash available when placed.
6:15-6:40	Stay on Assurance or Model Declaration > Overview.	State the model limits and AI contribution. Explain one correction you reviewed and that you remain responsible for understanding and validating the work. Stop recording.

Keep the pace natural: pause briefly on important numbers and expand only the calculation you are discussing. If you fall behind, shorten narration rather than rushing through the required evidence.

Talking points

Figures below belong to the currently selected Submitted Run. All amounts are Australian dollars.

Run ID

RUN-9b7eb376-bdb7-434a-87ee-bf4f93bb698d

Period and starting position	Whole-run result
27 August - 25 October 2026 48 products across eight categories Opening inventory: A$4,795.95 Opening cash: A$15,000.00	13,897 customers | 13,782 transactions 50,073 units sold Revenue: A$194,842.20 Gross profit: A$93,629.10

Product mix drives gross profit

Evidence: Ready to eat generated the largest category gross profit: **A$17,331.60**, with A$34,095.70 revenue and 5,461 units sold. Weekdays averaged 200.8 customers; weekends averaged 303.4.

Interpretation and next step: The assumed mission mix and product margins shape this result. Pilot the location, count hourly visitors and measure baskets, then calibrate the range. These are simulated preferences, not validated customer behaviour.

Availability comes with a waste trade-off

Evidence: Perishables lost **43 units** to expiry, costing **A$75.70**, while **914 perishable requested units** went unfilled. Across all products, 1,440 requested units were missed.

Interpretation and next step: Next-day orders cannot repair today's stockout. More stock may improve availability but increase waste. Test smaller opening quantities and a day-of-week stock allowance in a new run, comparing missed demand with write-off cost. Shelf life and delivery timing are fixed.

Cash growth does not establish viability

Evidence: Closing cash was **A$113,274.05**; closing inventory was only **A$75.30**. Cash growth includes A$4,720.65 of opening-to-closing inventory reduction.

Interpretation and next step: Sales are paid immediately, opening stock is funded separately, and target stock falls near Day 60. Add real operating expenses to a feasibility model and test ongoing replenishment. Rent, utilities, hardware and other overheads are excluded.

A short AI statement

"ChatGPT through Codex helped draft the model, implement and debug the app, and develop tests. I reviewed the generated work. For example, reconciliation was tested with deliberately corrupted revenue, cash and expired-sale records. I remain responsible for the code, assumptions and conclusions."

Use the AI statement only after reviewing and understanding those examples. The README documents the collaboration and corrections.

Trace, check and submit

Use one concrete audit example, then verify the finished recording.

Trace the bread expiry

1. Diagnosis > Availability & waste > **Trace to Day 45**. The Daily Report opens with **P25, White bread 650 g** selected. In Inventory, show **33 opening + 9 received - 30 sold - 12 expired = 0 closing**. The product also had six missed units.

2. In Store Brain, show the expiry record: **12 units in batch 4908** were removed before customers arrived. Expand its Calculation: **12 x A$1.70 = A$20.40** written off.

3. In Records, select **Inventory movements**, Day 45 and P25. Show the expiry movement and batch ID. For the source batch, choose **Receipt batches** and **Day 42**: batch 4908 arrived with 22 units and expired on Day 45.

4. For a transaction example, choose **Transactions**, **Day 45** and P25, then **View transaction**. Show the requested basket, sold items and source batches, stock deductions and cash receipt. This is a valid sale, not a sale of the expired batch. Expand its totals if time allows.

Show the assurance checks

In Assurance, show **60/60 days**, the Submitted Run ID and retained records. Inventory uses opening + received - sold - expired = closing. Revenue compares daily totals with transactions and sold items. Expand Revenue reconciliation; show the Operating cash equation.

Cash: A$15,000.00 + A$194,842.20 - A$96,568.15 = **A$113,274.05**. Negative stock, overselling, expired sales and unaffordable orders are all zero. Stockouts and legitimate write-offs are business outcomes; they do not automatically mean integrity failure.

Finish the MP4

In OBS, select **Stop Recording**. Use **File > Remux Recordings**, choose the MKV and select **Remux** to produce MP4. Do not just rename the extension. See the official OBS recording guide.

Final check	What to confirm
Video	MP4, 4-8 minutes, audible narration, readable website text, face and student ID shown.
Coverage	Setup, Run ID, all four report areas, three recommendations, one day, one Brain decision, an audit trace, assurance and AI contribution.
Upload	Play the final MP4 from start to finish, submit it directly to the LMS, and check uploaded playback. Submit the source ZIP separately.
